Hoop Glider
Learn how to make a gliding contraption with strange looking wings!

Materials

- Straw or piece of carton to make a straw (see template on page 2)
- Long strip of paper (long edge of paper, see page 2)
- Short strip of paper (long edge of paper cut in half)
- Tape
- Crayons or markers (optional: for decorations).

Try this!

**Step 1:** Make or place the straw on the table (make a triangular straw by folding carton piece three times along the long edge and fasten with tape).
**Step 2:** Place long strip of paper under one end of the straw.
**Step 3:** Move the piece of paper so that the straw is placed at the center of the length of the strip of paper forming a T shape. Add a piece of tape over the straw to fasten the piece of paper.
**Step 4:** Repeat step 3 on the other end of the straw with the short piece of paper.
**Step 5:** Grab each end of the long piece of paper and curl them toward each other until the tips overlap to make them into a hoop. Tape the ends together.
**Step 6:** Repeat step 5 with the short piece of paper. Now you have a big hoop and a small hoop.
**Step 7:** Hold your Hoop Glider in the middle of the straw, with the small hoop in front. Throw it gently like a spear. It might take some practice to get the hang of it.

What’s going on?

Animals that fly, like insects, birds, and bats, all have wings. But wings are not all the same shape and size. Different wings can be better for different kinds of flight. A great example are butterfly wings, they come in many different shapes and sizes, and scientists at the Florida Museum are studying how this affects their flight. Let’s do an experiment! What would happen if you change the size of the straw or hoops? Or, what happens if you add a third hoop? Choose one thing to change (that’s a variable), and make a prediction.
